COLLECTIONS & ASSORTMENTS OF EXTRA CHOICE FLOWER SEEDS.

Sow Aster seed in April and May, in pans or on a spent hot-bed, in drills 6 inches asunder; when the plants are 1 inch high, prick out into a cold frame, or under hand-glasses, 3 or 4 inches apart, from whence they can be planted out when 4 inches high. Select showery weather for planting out, when the ground is in good working order; plant in rows 1 foot apart each way. To grow Asters to perfection, a rich soil is indispensable, and during dry weather they should be watered, and a top-dressing of well-rotted manure applied early in August.

TIME OF SOWING.

HARDY ANNUALS may be sown in March and April (and for early Spring blooming in August and September), in a sheltered situation, and when up, thinned so as to keep them strong. In March they may be transplanted where they are to bloom. Before sowing, which should be done on a fine dry day, carefully prepare the soil, and in covering, regulate the thickness by the size of the seeds—small seeds should be very lightly covered. Success in growing annuals depends in a great measure upon their being properly thinned to regular distances, so as to give plenty of room for the full development of each plant; this, in too many instances, is entirely neglected, hence the dissatisfaction so often expressed as to their use.

HALF-HARDY ANNUALS may be sown in March and April, in pans, placed on a slight hot-bed, and, when strong enough, pricked out into a cool frame near the glass, where they may get hardened and well established for transplanting into their blooming quarters early in May, or potted off singly for Conservatory and Greenhouse decorations. Under favourable circumstances many varieties will bloom freely if sown in the open ground about the middle of May.

TENDER ANNUALS such as Balsams, Celosias, Thunbergias, &c., require raising in a temperature ranging from 60° to 70°. Sow in pans or pots, and place near the glass; keep the soil moist, and shade from the sun until the plants appear. When strong enough, pot off into small pots, keeping them near the glass, and admitting air on every favourable occasion.

BIENNIALS AND PERENNIALS.—The more select and tender varieties for Summer and Autumn blooming may be sown in a gentle heat in March and April, and pricked out into pots until fully established, and then potted off singly, or transplanted into the open ground, as required. The hardier varieties may be sown in the open ground, in prepared beds, in June and July, and when strong enough transplanted into nursery beds, or where they are intended to bloom the following year.

In ordering Flower Seeds it will be sufficient to quote the marginal numbers.

DOUBLE TUBEROSES.

The perfectly double flowers of *Polianthes* are well known for their delicious fragrance and pearly whiteness, being admirably adapted for Button-holes, Bouquets, &c.; indeed, are of the greatest value wherever cut flowers are required. By successional plantings these lovely flowers may be had all through the Summer and Autumn. They should be potted in rich loamy soil and started in a good bottom heat, being afterwards grown on in a stove, with plenty of moisture.

DIRECTIONS FOR USE.

For MAKING A VINE BORDER.—Use 56 lbs. to a ton or cubic yard of loam.

For MAKING BORDERS for PEACHES, NECTARINES, FIGS, &c.—28 lbs. to the ton or cubic yard.

For TOP DRESSING VINE BORDERS.—Mix about 2 lbs. to a barrow-load of good loam, spreading to a depth of 2 to 3 inches. If roots are not too near the surface, about 1 lb. to the square yard may be forked in, instead of top dressing. As soon as the berries are making good headway, give a slight sprinkling over the surface, and repeat about every fortnight or three weeks as occasion requires.

For VINES IN POTS.—Sprinkle a dessertspoonful on the surface as soon as the berries begin to swell freely, well mulching over a little later, following with an occasional sprinkling of the Food as progress is made.

For POT PLANTS AND BULBS.—Sprinkle on the surface of the soil about every three weeks, at the rate of a small teaspoonful to a 5-inch pot, so that, when the plants are watered, the Plant Food will be gradually absorbed into the soil.

For CHRYSANTHEMUMS.—At the time of potting, some of the Plant Food should be thoroughly mixed with the compost, and afterwards, when the buds begin to swell, frequent top-dressings should be given, the quantity used being estimated according to the size of the pots and vigour of the plants.

For ROSES, SHRUBS, &c., in Pots.—Use about a tablespoonful to a 12-inch pot several times during the season.

For STRAWBERRIES in the open.—Well fork into the ground before planting 14 lbs. to the rod, giving several surface applications after the fruit has set.

For TOMATOES, CUCUMBERS, &c.—Mix 2 lbs. to the barrow-load of compost, applying a surface dressing several times to assist growth of the fruit.

For PLANTS, FRUITS, ROSES, and all Plants in Borders and the Open Ground.—Apply about 4 oz. to the square yard as often as occasion may require, raking and watering it in.

For LAWNS.—Scatter broadcast at the rate of 2 oz. to the square yard, and well water.

For GENERAL POTTING Purposes.—Mix 2 lbs. to the barrow-load of compost.

20/- per cwt.; £18 per ton; 56 lbs. 12/6; 28 lbs. 7/6; 14 lbs. 4/6.
Also in Tins, containing about 1½ lb., at 1/- Larger Size (about 5 lbs.) 2/6.
